

$$\theta_i = \log r_i + \log \alpha_i + \kappa_{\text{pop}} \cdot \log t$$

input rate *efficiency* *population scaling exponent (NEW; shared)* *time*

The diagram illustrates the components of the equation $\theta_i = \log r_i + \log \alpha_i + \kappa_{\text{pop}} \cdot \log t$. Below each term, there is a label in italics. A blue arrow points from 'input rate' to $\log r_i$, a blue arrow points from 'efficiency' to $\log \alpha_i$, a red arrow points from 'population scaling exponent (NEW; shared)' to κ_{pop} , and a blue arrow points from 'time' to $\log t$. The label for κ_{pop} is in red, while the others are in blue.
